HARSHUL MAHAJAN

SELECTED WORKS 2024-2025

Hello! I'm delighted to share my portfolio with you. It highlights the selected projects that reflect my experience over the past few semesters at Jindal School of Design And Architecture.

Working on multiple projects in previous semesters, I've been able to develop few works that have been presented here. I have developed my skills by exploring various software.

Software:

- Auto Cad
- Sketchup
- Affinity
- Twin Motion
- D5
- DaVinci Resolve

INTERNSHIP WORK

01 Stuff & Space

Semester-3

About the project

This project aimed to design a multidimensional house for a family of 16 members on a site located in Behrampur (West Bengal). Based on the given site, I developed a detailed architectural plan and a 3D rendered model of the house.

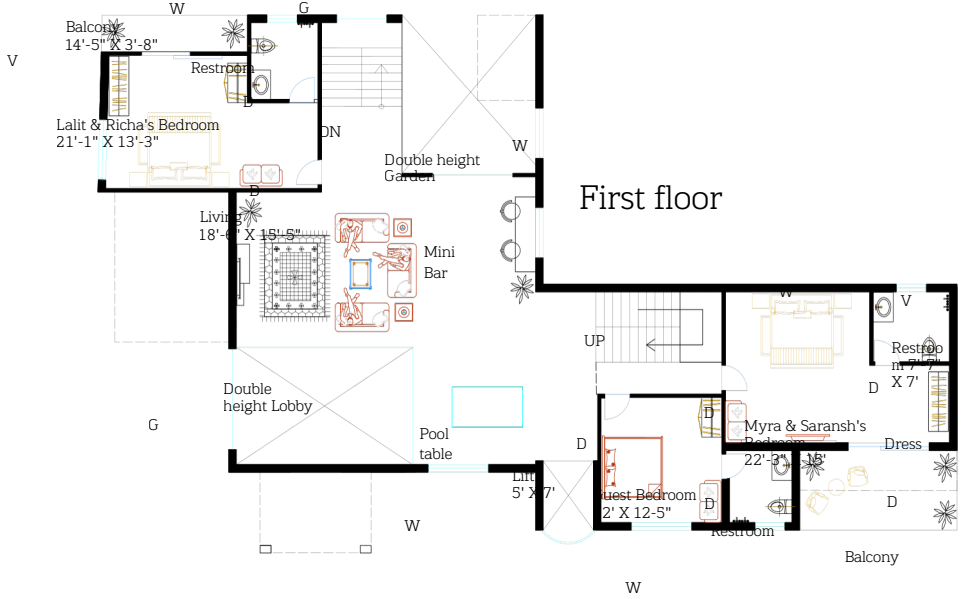

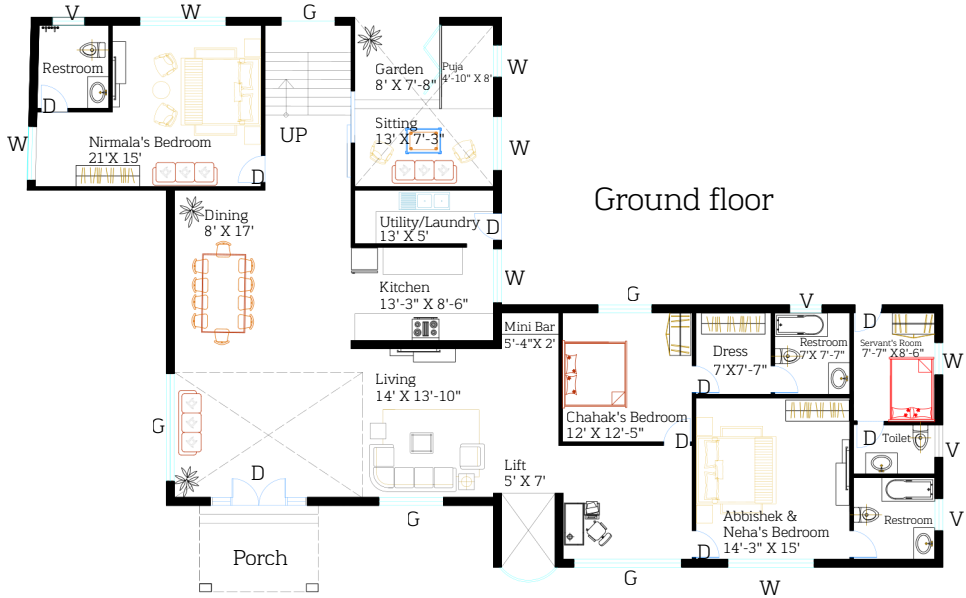

The objective of the project was to develop an understanding of spatial organization, circulation patterns, and functional zoning within a large family residence. It focused on determining how the rooms for different family members should be arranged, how movement within the house should flow efficiently, and how furniture and other household elements should be organized within the spaces.

02 Light & Sound

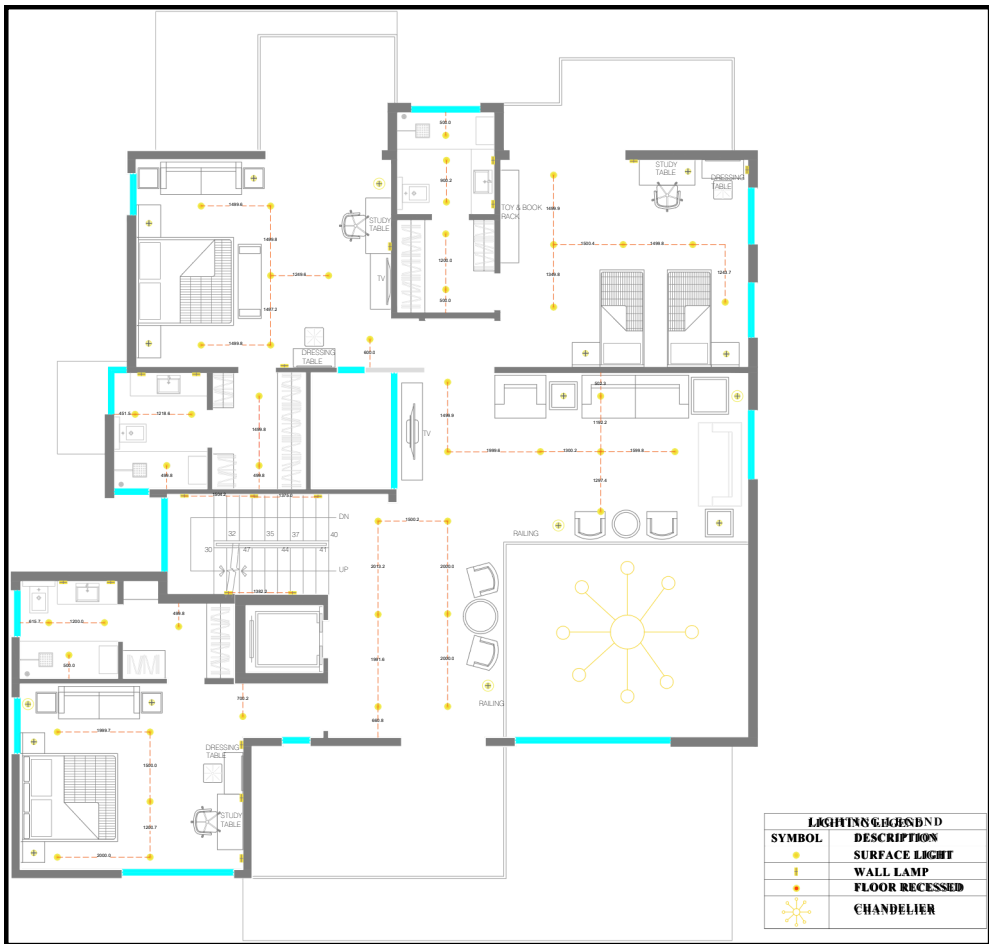

Semester-3

About the project

The aim of this project is to develop an appropriate and visually balanced lighting design for a residential house by identifying and selecting suitable lighting fixtures and their placements based on the function and character of each space. The focus is on choosing the right types of lights and fixtures for different areas, ensuring proper brightness, comfort, and aesthetics to make the spaces both practical and visually appealing.

03 Rendered House

Semester-2

About the project

The aim of this project was to understand rendering techniques and how to visually represent a building and its surrounding spaces. We were provided with the floor plan of a house, based on which we created a 3D model using SketchUp software. The model was then rendered in Twin motion, where different textures and materials were applied to various spaces within the house to achieve a realistic visualization.

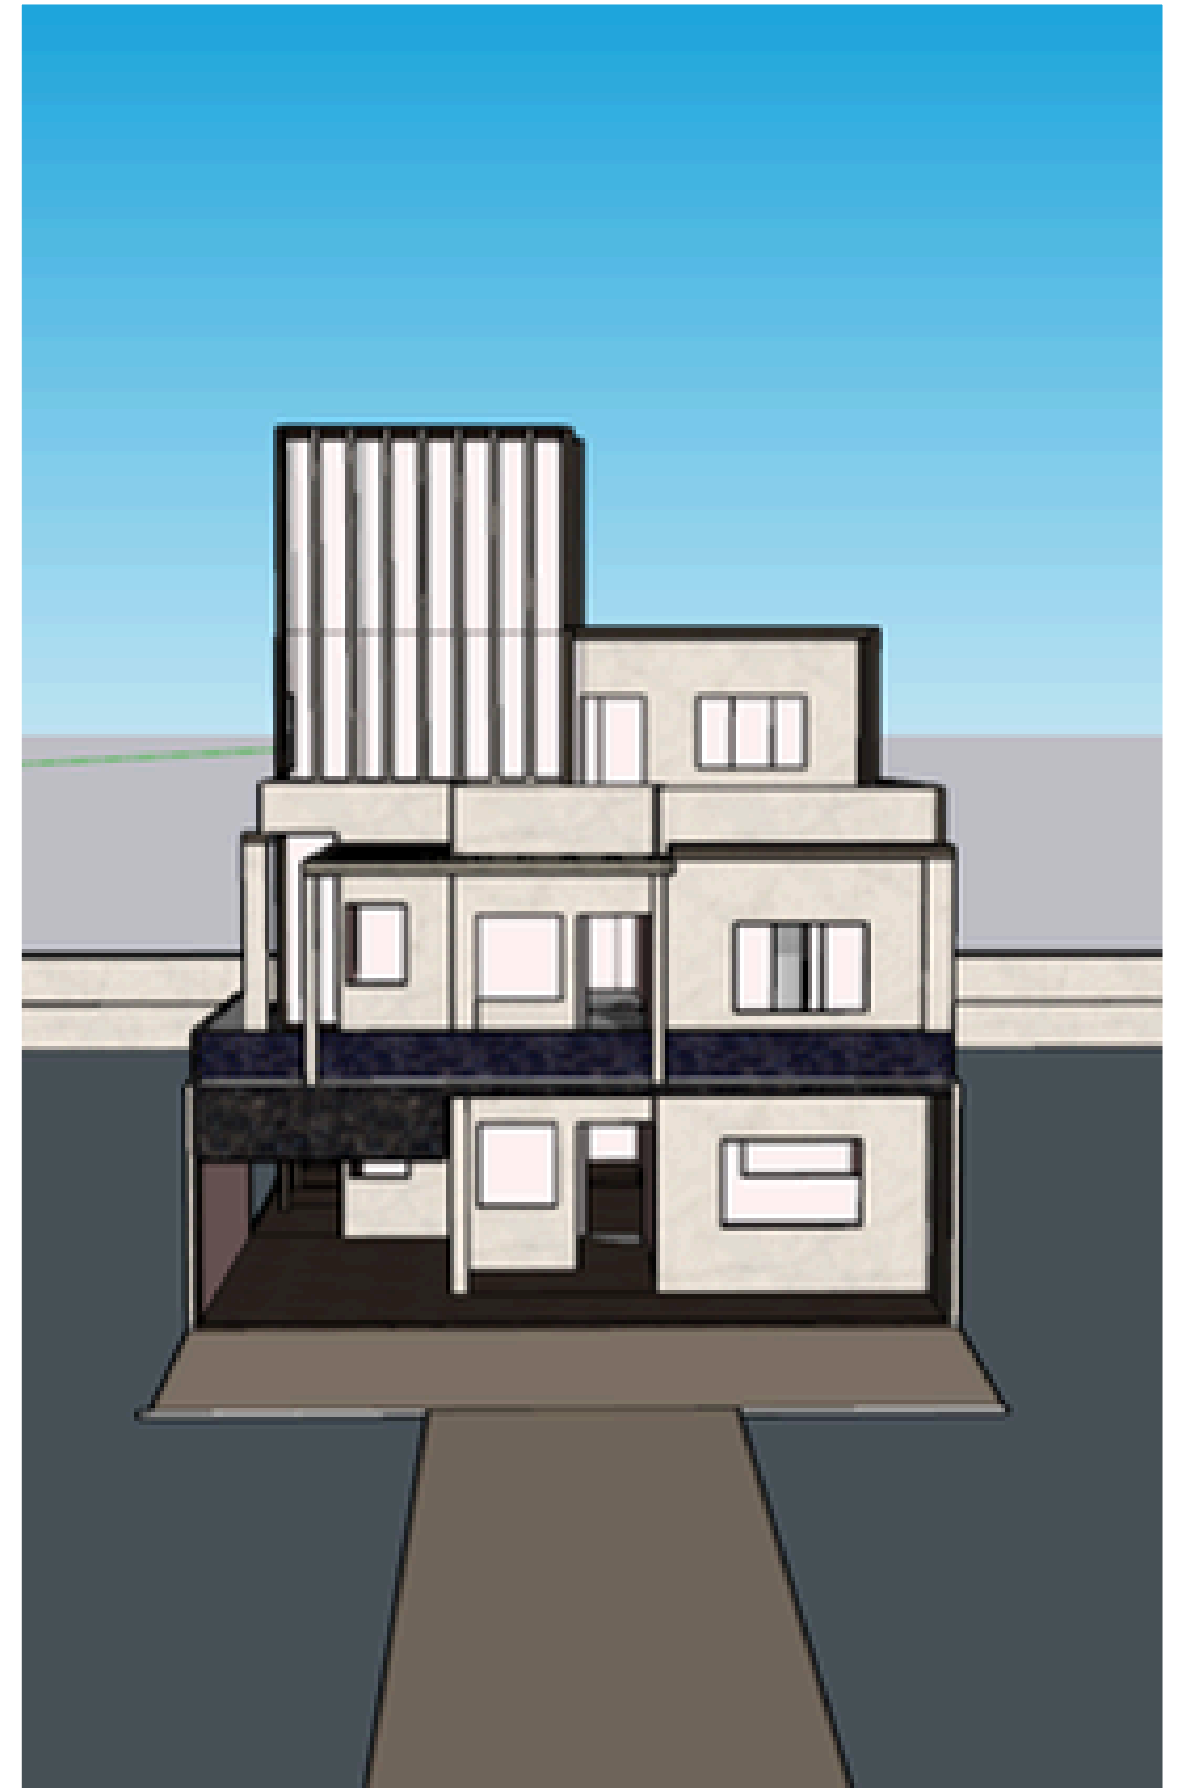

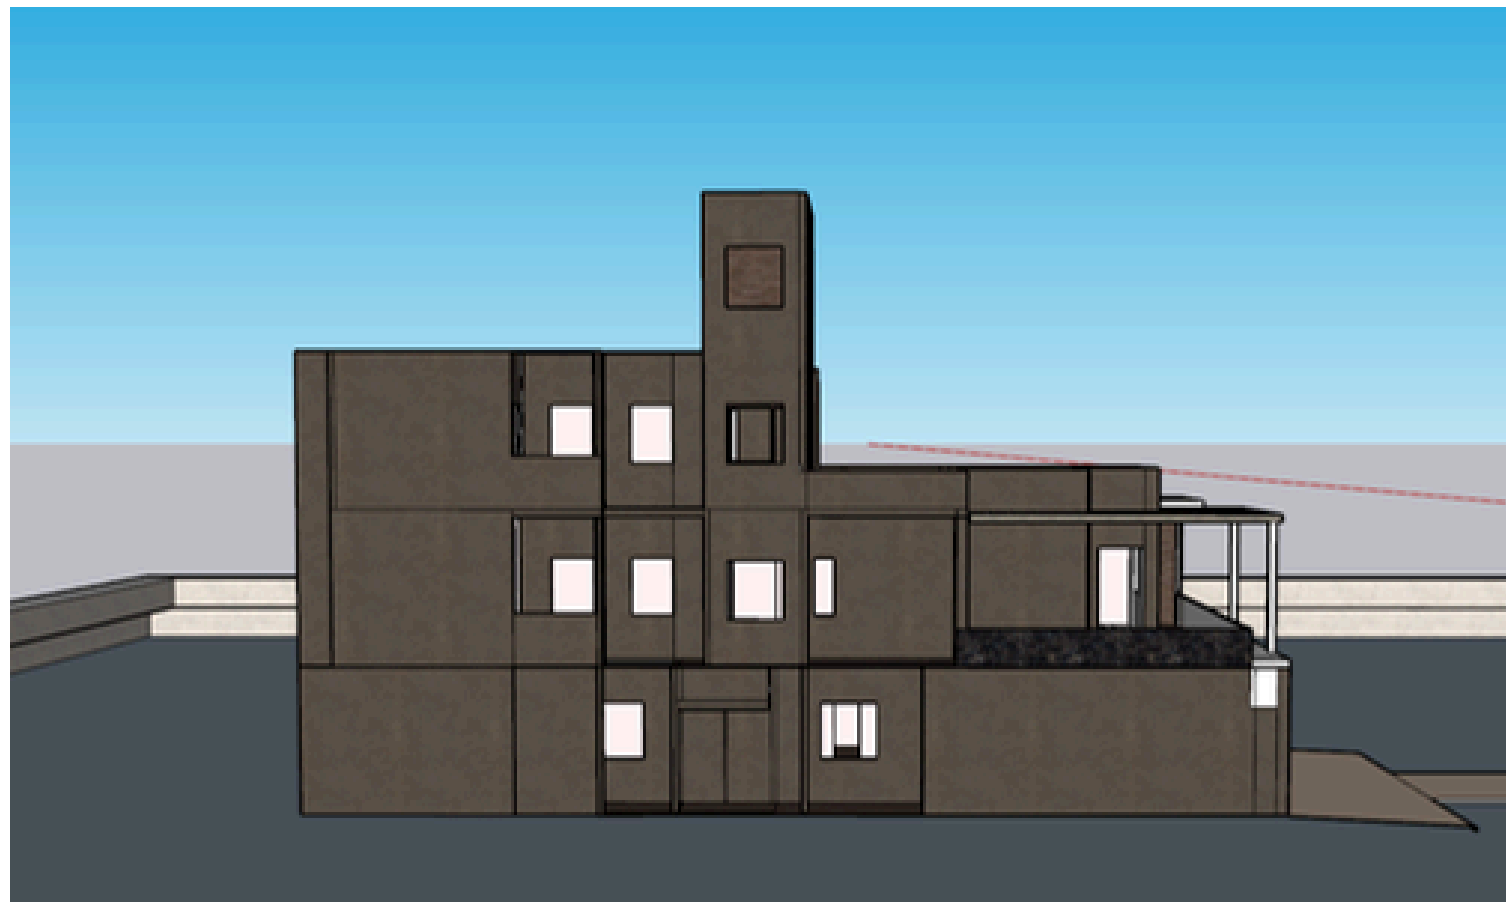

Software:

Sketch Up

Twin Motion

04 Facade Texturing

Semester-1

About the project

In this project, we were given the façade of a house and were required to apply appropriate textures to it along with the background using Affinity software. For this, we sourced images of different façade materials from Google and edited them within the software to create the final composition.

Software:

Affinity Photo

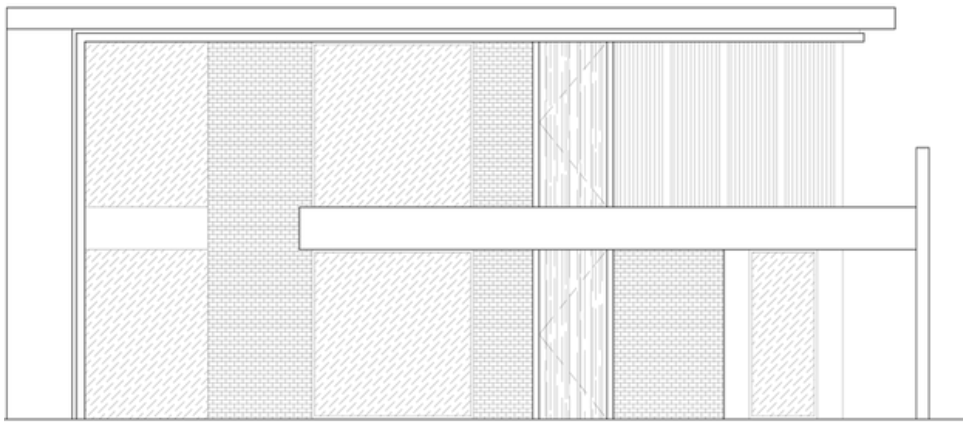

05 Internship Work

Location- Pathankot, Punjab

About the project

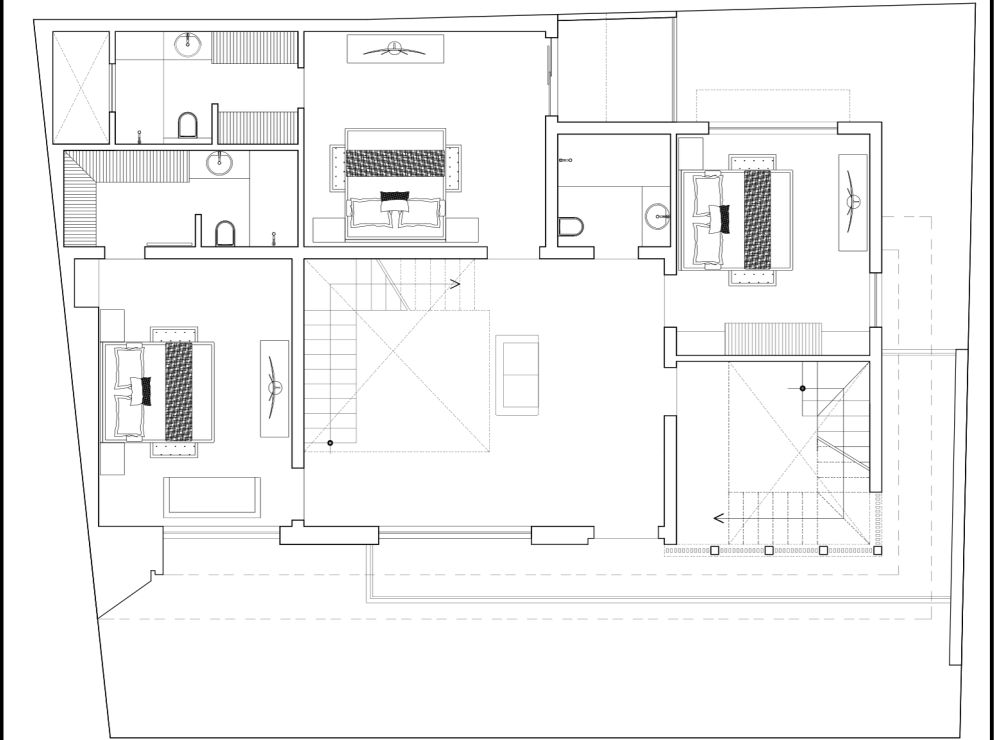

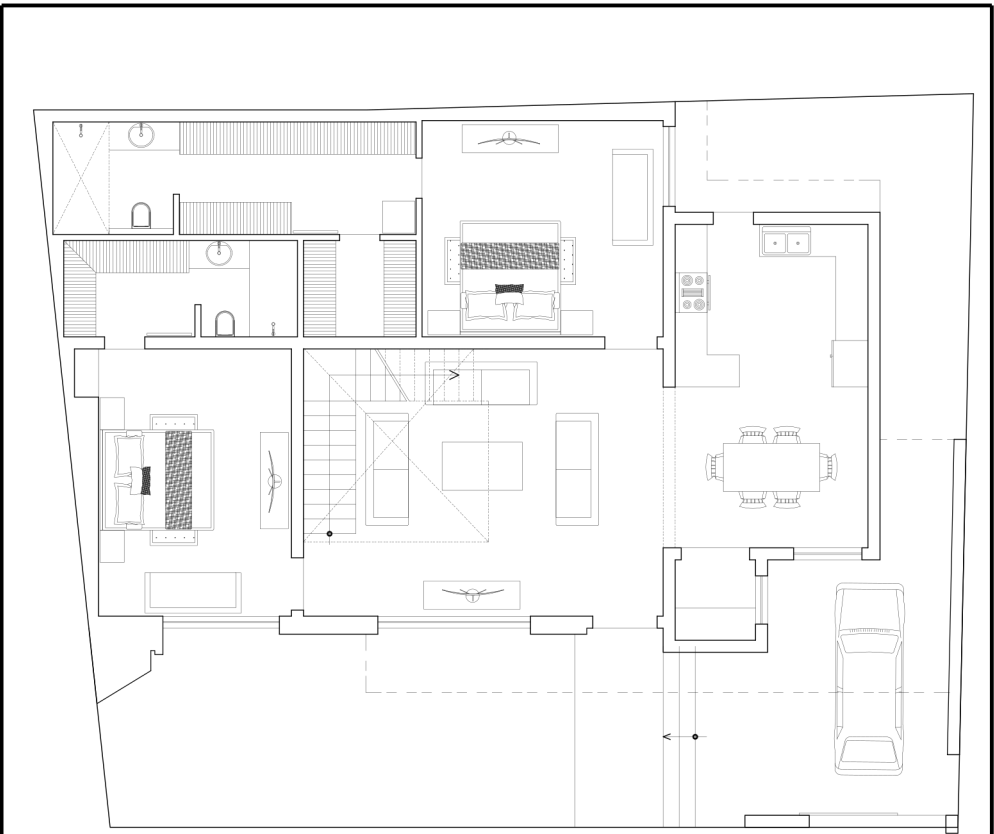

After completing my first year, I interned at a private architectural firm where I worked on a residential project. My responsibilities included developing the house plans with accurate measurements and appropriate space dimensions, incorporating furniture layouts, and creating a 3D model of the house. I also produced rendered views of the project using Twin motion software.
